SUMMARY

I build backend services in Node.js and TypeScript. That means the APIs, the database schemas behind them, and the React front ends when a project needs one, then deploying the whole thing and keeping it running. I currently do this for five client companies across Europe, Canada, and Uzbekistan, building REST integrations between separate systems, running self-hosted services on Linux and Docker, and supporting them after launch.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript (ES6+), Python, C#

Backend: Node.js, NestJS, Express, REST APIs, GraphQL

Frontend: React, TanStack Query, TailwindCSS, HTML5, CSS3

Databases: PostgreSQL, MongoDB, Supabase, Prisma, Mongoose

Practices: Git & GitHub, Docker, CI/CD (GitHub Actions), JWT auth, unit testing, Swagger/OpenAPI, webhooks and idempotent integrations

Cloud & Ops: DigitalOcean, Hetzner, Linux server administration

Currently learning: Redis and job queues (BullMQ), React Native (Expo)

EXPERIENCE

Full-Stack Developer · UzVIP Agency · Remote

Oct 2025 – Present

- Build and maintain production systems for **5 client companies in Europe, Canada, and Uzbekistan**.
- Built a **two-way appointment sync between two booking platforms**, using webhook handlers with idempotency and deduplication so the same booking is never written twice and staff stop getting double-booked.
- **Migrated a client's self-hosted Node.js service** to a new major version on Linux, with an external task-runner sidecar, containerised deployment, and a documented backup and restore procedure.
- Integrated a **65-endpoint third-party REST API** behind a typed client with custom header authentication.
- Delivered **20+ integrations and data syncs** across client systems, third-party APIs, and language models. Each one scoped with the client, then built, deployed, and supported by me. Platform tooling (n8n, GoHighLevel) where it fits the job.

Full-Stack Developer · Military University (JXU)

Oct 2022 – Oct 2025

- Built and maintained internal web tools used by university staff, including the database, backend, and interface for each tool.
- Started in C#/.NET, then moved to Node.js for new internal tools and Telegram bots.
- Implemented user authentication and access control for internal systems.
- Maintained and extended the tools after release, handling fixes, new features, and requests from staff.
- Supported internal software, hardware, and the databases behind them.

PROJECTS

TaskFlow · Kanban task manager

Full-stack board app with JWT auth and refresh-token rotation, per-user ownership checks on every mutation, unit tests, multi-stage Docker builds, and a GitHub Actions pipeline.

React · TypeScript · NestJS · MongoDB · Docker · github.com/AbduboriyAhmadjonov/TaskFlow

Simple Analytics API · privacy-first web analytics

Self-hosted page-view tracking service with daily, referrer, and browser breakdowns; DTO validation and full Swagger/OpenAPI documentation.

NestJS · MongoDB · Swagger · github.com/AbduboriyAhmadjonov/simple-analytics-api

Vocab Bot · vocabulary learning bot

Photograph a page of text and a vision model extracts the words into flashcards, with Leitner spaced repetition, generated audio tracks, and scheduled reminders. Language-neutral schema.

Python · Telegram Bot API · vision and language models · SQLite · github.com/AbduboriyAhmadjonov/vocab-bot

EDUCATION

B.Sc. Telecommunication Technologies (in progress) · Tashkent University of Information Technologies (TUIT) · expected 2027

Distance programme, studied alongside full-time work.

LANGUAGES

Uzbek (native) · English (B2, IELTS 6.5) · Russian (conversational; read technical documentation fluently)
